

CDCE913 Programmable 1-PLL VCXO Clock Synthesizer

With 1.8-V, 2.5-V, and 3.3-V Outputs

1 Features

- Member of Programmable Clock Generator Family
 - CDCE913/CDCEL913: 1-PLL, 3 Outputs
 - CDCE925/CDCEL925: 2-PLL, 5 Outputs
 - CDCE937/CDCEL937: 3-PLL, 7 Outputs
 - CDCE949/CDCEL949: 4-PLL, 9 Outputs
- In-System Programmability and EEPROM
 - Serial Programmable Volatile Register
 - Nonvolatile EEPROM to Store Customer Settings
- Flexible Input Clocking Concept
 - External Crystal: 8 MHz to 32 MHz
 - On-Chip VCXO: Pull Range ± 150 ppm
 - Single-Ended LVCMOS up to 160 MHz
- Free Selectable Output Frequency up to 230 MHz
- Low-Noise PLL Core
 - PLL Loop Filter Components Integrated
 - Low Period Jitter (Typical 50 ps)
- Separate Output Supply Pins
 - CDCE913: 3.3 V and 2.5 V
 - CDCEL913: 1.8 V
- Flexible Clock Driver
 - Three User-Definable Control Inputs [S0/S1/S2], for Example, SSC Selection, Frequency Switching, Output Enable, or Power Down
 - Generates Highly Accurate Clocks for Video, Audio, USB, IEEE1394, RFID, Bluetooth®, WLAN, Ethernet, and GPS
 - Generates Common Clock Frequencies Used With TI-DaVinci™, OMAP™, DSPs
 - Programmable SSC Modulation
 - Enables 0-PPM Clock Generation
- 1.8-V Device Power Supply
- Wide Temperature Range -40°C to 85°C
- Packaged in TSSOP
- Development and Programming Kit for Easy PLL Design and Programming (TI Pro-Clock™)

2 Applications

D-TVs, STBs, IP-STBs, DVD Players, DVD Recorders, and Printers

3 Description

The CDCE913 and CDCEL913 devices are modular PLL-based, low-cost, high-performance, programmable clock synthesizers. They generate up to three output clocks from a single input frequency. Each output can be programmed in-system for any clock frequency up to 230 MHz, using the integrated configurable PLL.

The CDCx913 has separate output supply pins, V_{DDOUT} , which is 1.8 V for CDCEL913 and 2.5 V to 3.3 V for CDCE913.

The input accepts an external crystal or LVCMOS clock signal. A selectable on-chip VCXO allows synchronization of the output frequency to an external control signal.

The PLL supports SSC (spread-spectrum clocking) for better electromagnetic interference (EMI) performance.

The device supports nonvolatile EEPROM programming for easy customization of the device to the application. All device settings are programmable through the SDA/SCL bus, a 2-wire serial interface.

The CDCx913 operates in a 1.8-V environment. It operates in a temperature range of -40°C to 85°C .

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
CDCE913 CDCEL913	TSSOP (14)	5.00 mm x 4.40 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision E (March 2010) to Revision F	Page
• Added ESD Ratings table, Feature Description section, Device Functional Modes, Application and Implementation section, Power Supply Recommendations section, Layout section, Device and Documentation Support section, and Mechanical, Packaging, and Orderable Information section	1
• Added in Figure 9, second S to Sr	14
• Changed 100 MHz < f _{VCO} > 200 MHz; TO 80 MHz ≤ f _{VCO} ≤ 230 MHz; and changed 0 ≤ p ≤ 7 TO 0 ≤ p ≤ 4	23
• Changed under Example, fifth row, N", 2 places TO N'	23

Changes from Revision D (October 2009) to Revision E	Page
• Added PLL settings limits: 16≤q≤63, 0≤p≤7, 0≤r≤511, 0<N<4096 foot to PLL1 Configure Register Table	19
• Added PLL settings limits: 16≤q≤63, 0≤p≤7, 0≤r≤511 to PLL Multiplier/Divider Definition Section.....	22

Changes from Revision C (August 2007) to Revision D	Page
• Deleted sentence - A different default setting can be programmed upon customer request. Contact Texas Instruments sales or marketing representative for more information.	12

5 Pin Configuration and Functions

Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
GND	5, 10	Ground	Ground
SCL/S2	12	I	SCL : serial clock input LVCMOS (default configuration), internal pullup 500 kΩ or S2 : user-programmable control input; LVCMOS inputs; 500-kΩ internal pullup
SDA/S1	13	I/O or I	SDA : bidirectional serial data input/output (default configuration), LVCMOS internal pullup; or S1 : user-programmable control input; LVCMOS inputs; 500-kΩ internal pullup
S0	2	I	User-programmable control input S0; LVCMOS inputs; 500-kΩ internal pullup
V _{Ctrl}	4	I	VCXO control voltage (leave open or pull up when not used)
V _{DD}	3	Power	1.8-V power supply for the device
V _{DDOUT}	6, 7	Power	CDCE913 : 3.3-V or 2.5-V supply for all outputs
			CDCEL913 : 1.8-V supply for all outputs
Xin/CLK	1	I	Crystal oscillator input or LVCMOS clock Input (selectable through SDA/SCL bus)
Xout	14	O	Crystal oscillator output (leave open or pull up when not used)
Y1	11	O	LVCMOS outputs
Y2	9	O	LVCMOS outputs
Y3	8	O	LVCMOS outputs

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

			MIN	MAX	UNIT
V _{DD}	Supply voltage		–0.5	2.5	V
V _{DDOUT}	Output clocks supply voltage	CDCEL913	–0.5	V _{DD}	V
		CDCE913	–0.5	3.6 + 0.5	
V _I	Input voltage ⁽²⁾⁽³⁾		–0.5	V _{DD} + 0.5	V
V _O	Output voltage ⁽²⁾		–0.5	V _{DDOUT} + 0.5	V
I _I	Input current (V _I < 0, V _I > V _{DD})			20	mA
I _O	Continuous output current			50	mA
T _J	Maximum junction temperature			125	°C
T _{stg}	Storage temperature		–65	150	

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) The input and output negative voltage ratings may be exceeded if the input and output clamp-current ratings are observed.

(3) SDA and SCL can go up to 3.6 V as stated in the *Recommended Operating Conditions* table.

CDCE913, CDCEL913

SCAS849F –JUNE 2007 –REVISED APRIL 2015

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾	±1500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
V_{DD}	Device supply voltage	1.7	1.8	1.9	V
V_O	Output Yx supply voltage for CDCE913, V_{DDOUT}	2.3		3.6	V
	Output Yx supply voltage for CDCEL913, V_{DDOUT}	1.7		1.9	
V_{IL}	Low-level input voltage, LVCMOS			0.3 V_{DD}	V
V_{IH}	High-level input voltage, LVCMOS	0.7 V_{DD}			V
$V_{I(thresh)}$	Input voltage threshold, LVCMOS		0.5 V_{DD}		V
$V_{I(S)}$	Input voltage range, S0	0		1.9	V
	Input voltage range S1, S2, SDA, SCL; $V_{I(thresh)} = 0.5 V_{DD}$	0		3.6	
$V_{I(CLK)}$	Input voltage range CLK	0		1.9	V
I_{OH}/I_{OL}	Output current ($V_{DDOUT} = 3.3 V$)			±12	mA
	Output current ($V_{DDOUT} = 2.5 V$)			±10	
	Output current ($V_{DDOUT} = 1.8 V$)			±8	
C_L	Output load, LVCMOS			15	pF
T_A	Operating free-air temperature	–40		85	°C
RECOMMENDED CRYSTAL/VCXO SPECIFICATIONS⁽¹⁾					
f_{Xtal}	Crystal input frequency range (fundamental mode)	8	27	32	MHz
ESR	Effective series resistance			100	Ω
f_{PR}	Pulling range ($0 V \leq V_{Ctrl} \leq 1.8 V$) ⁽²⁾	±120	±150		ppm
	Frequency control voltage, V_{Ctrl}	0		V_{DD}	V
C_0/C_1	Pullability ratio			220	
C_L	On-chip load capacitance at Xin and Xout	0		20	pF

(1) For more information about VCXO configuration, and crystal recommendation, see application report (SCAA085).

(2) Pulling range depends on crystal type, on-chip crystal load capacitance, and PCB stray capacitance; pulling range of minimum ±120 ppm applies for crystal listed in the application report (SCAA085).

6.4 Thermal Information⁽¹⁾⁽²⁾

over operating free-air temperature range (unless otherwise noted)

THERMAL METRIC ⁽³⁾		CDCEx913	UNIT	
		PW [TSSOP]

8 Detailed Description

8.1 Overview

The CDCE913 and CDCEL913 devices are modular PLL-based, low-cost, high-performance, programmable clock synthesizers, multipliers, and dividers. They generate up to three output clocks from a single input frequency. Each output can be programmed in-system for any clock frequency up to 230 MHz, using the integrated configurable PLL.

The CDCx913 has separate output supply pins, VDDOUT, which is 1.8 V for CDCEL913 and 2.5 V to 3.3 V for CDCE913.

The input accepts an external crystal or LVCMOS clock signal. If an external crystal is used, an on-chip load capacitor is adequate for most applications. The value of the load capacitor is programmable from 0 to 20 pF. Additionally, a selectable on-chip VCXO allows synchronization of the output frequency to an external control signal, that is, the PWM signal.

The deep M/N divider ratio allows the generation of zero-ppm audio/video, networking (WLAN, Bluetooth, Ethernet, GPS) or interface (USB, IEEE1394, memory stick) clocks from, for example, a 27-MHz reference input frequency.

The PLL supports spread-spectrum clocking (SSC). SSC can be center-spread or down-spread clocking, which is a common technique to reduce electromagnetic interference (EMI).

Based on the PLL frequency and the divider settings, the internal loop filter components are automatically adjusted to achieve high stability and optimized jitter transfer characteristics.

The device supports nonvolatile EEPROM programming for easy customization of the device to the application. It is preset to a factory default configuration (see [Default Device Configuration](#)). It can be reprogrammed to a different application configuration before PCB assembly, or reprogrammed by in-system programming. All device settings are programmable through the SDA/SCL bus, a 2-wire serial interface.

Three programmable control inputs, S0, S1, and S2, can be used to select different frequencies, change SSC setting for lowering EMI, or control other features like outputs disable to low, outputs 3-state, power down, PLL bypass, and so forth).

The CDCx913 operates in a 1.8-V environment. It operates in a temperature range of -40°C to 85°C .

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Control Terminal Configuration

The CDCE913/CDCEL913 has three user-definable control terminals (S0, S1, and S2), which allow external control of device settings. They can be programmed to any of the following functions:

- Spread-spectrum clocking selection → spread type and spread amount selection
- Frequency selection → switching between any of two user-defined frequencies
- Output state selection → output configuration and power-down control

The user can predefine up to eight different control settings. [Table 1](#) and [Table 2](#) explain these settings.

Table 1. Control Terminal Definition

EXTERNAL CONTROL BITS	PLL1 SETTING			Y1 SETTING
Control function	PLL frequency selection	SSC selection	Output Y2/Y3 selection	Output Y1 and power-down selection

Table 2. PLLx Setting (Can Be Selected for Each PLL Individually)⁽¹⁾

SSCx [3 Bits]			CENTER	DOWN
SSC SELECTION (CENTER/DOWN)				
0	0	0	0% (off)	0% (off)
0	0	1	±0.25%	–0.25%
0	1	0	±0.5%	–0.5%
0	1	1	±0.75%	–0.75%
1	0	0	±1.0%	–1.0%
1	0	1	±1.25%	–1.25%
1	1	0	±1.5%	–1.5%
1	1	1	±2.0%	–2.0%

(1) Center/down-spread, Frequency0/1 and State0/1 are user-definable in PLLx configuration register.

Table 3. PLLx Setting, Frequency Selection (Can Be Selected for Each PLL Individually)⁽¹⁾

FSx	FUNCTION
0	Frequency0
1	Frequency1

(1) Frequency0 and Frequency1 can be any frequency within the specified f_{VCO} range.

Table 4. PLLx Setting, Output Selection⁽¹⁾ (Y2 ... Y3)

YxYx	FUNCTION
0	State0
1	State1

(1) State0/1 selection is valid for both outputs of the corresponding PLL module and can be power down, 3-state, low, or active.

Y1	FUNCTION
0	State 0
1	State 1

(1) State0 and State1 are user definable in the generic configuration register and can be power down, 3-state, low, or active.

CDCE913, CDCEL913

SCAS849F –JUNE 2007 –REVISED APRIL 2015

www.ti.com

S1/SDA and S2/SCL pins of the CDCE913/CDCEL913 are dual-function pins. In the default configuration, they are defined as SDA/SCL for the serial programming interface. They can be programmed as control pins (S1/S2) by setting the appropriate bits in the EEPROM. Note that changes to the control register (Bit [6] of byte **02h**) have no effect until they are written into the EEPROM.

Once they are set as control pins, the serial programming interface is no longer available. However, if V_{DDOUT} is forced to GND, the two control pins, S1 and S2, temporally act as serial programming pins (SDA/SCL).

S0 is **not** a multi-use pin; it is a control pin only.

8.3.2 Default Device Configuration

The internal EEPROM of CDCE913/CDCEL913 is pre-configured with a factory default configuration as shown in Figure 6 (The input frequency is passed through the output as a default). This allows the device to operate in default mode without the extra production step of programming it. The default setting appears after power is supplied or after power-down/up sequence until it is reprogrammed by the user to a different application configuration. A new register setting is programmed through the serial SDA/SCL interface.

Figure 6. Default Configuration

Table 6 shows the factory default setting for the Control Terminal Register. Note that even though eight different register settings are possible, in the default configuration, only the first two settings (0 and 1) can be selected with S0, as S1 and S2 are configured as programming pins in default mode.

Table 6. Factory Default Setting for Control Terminal Register⁽¹⁾

			Y1	PLL1 SETTINGS		
EXTERNAL CONTROL PINS			OUTPUT SELECTION	FREQUENCY SELECTION	SSC SELECTION	OUTPUT SELECTION
S2	S1	S0	Y1	FS1	SSC1	Y2Y3
SCL (I2C)	SDA (I2C)	0	3-state	f_{VCO1_0}	off	3-state
SCL (I2C)	SDA (I2C)	1	Enabled	f_{VCO1_0}	off	Enabled

(1) In default mode or when programmed respectively, S1 and S2 act as serial programming interface, SDA/SCL. They do not have any control-pin function but they are internally interpreted as if S1 = 0 and S2 = 0. S0, however, is a control pin, which in the default mode switches all outputs ON or OFF (as previously predefined).

8.3.3 SDA/SCL Serial Interface

The CDCE913/CDCEL913 operates as a slave device of the 2-wire serial SDA/SCL bus, compatible with the popular SMBus or I²C specification. It operates in the standard-mode transfer (up to 100 kbit/s) and fast-mode transfer (up to 400 kbit/s) and supports 7-bit addressing.

The S1/SDA and S2/SCL pins of the CDCE913/CDCEL913 are dual function pins. In the default configuration, they are used as the SDA/SCL serial programming interface. They can be reprogrammed as general-purpose control pins, S1 and S2, by changing the corresponding EEPROM setting, byte **02h**, bit [6].

8.3.4 Data Protocol

The device supports *Byte Write and Byte Read* and *Block Write and Block Read* operations.

For *Byte Write/Read* operations, the system controller can individually access addressed bytes.

For *Block Write/Read* operations, the bytes are accessed in sequential order from lowest to highest byte (with most-significant bit first) with the ability to stop after any complete byte has been transferred. The numbers of bytes read out are defined by Byte Count in the generic configuration register. At the *Block Read* instruction, all bytes defined in Byte Count must be read out to finish the read cycle correctly.

Once a byte has been sent, it is written into the internal register and is effective immediately. This applies to each transferred byte, regardless of whether this is a *Byte Write* or a *Block Write* sequence.

If the EEPROM write cycle is initiated, the internal SDA registers are written into the EEPROM. During this write cycle, data is not accepted at the SDA/SCL bus until the write cycle is completed. However, data can be read out during the programming sequence (*Byte Read* or *Block Read*). The programming status can be monitored by *EEPIP*, byte 01h–bit 6.

The offset of the indexed byte is encoded in the command code, as described in [Table 7](#).

Table 7. Slave Receiver Address (7 Bits)

DEVICE	A6	A5	A4	A3	A2	A1 ⁽¹⁾	A0 ⁽¹⁾	R/W
CDCE913/CDCEL913	1	1	0	0	1	0	1	1/0
CDCE925/CDCEL925	1	1	0	0	1	0	0	1/0
CDCE937/CDCEL937	1	1	0	1	1	0	1	1/0
CDCE949/CDCEL949	1	1	0	1	1	0	0	1/0

(1) Address bits A0 and A1 are programmable through the SDA/SCL bus (byte 01, bits [1:0]). This allows addressing up to 4 devices connected to the same SDA/SCL bus. The least-significant bit of the address byte designates a write or read operation.

8.4 Device Functional Modes

8.4.1 SDA/SCL Hardware Interface

[Figure 7](#) shows how the CDCE913/CDCEL913 clock synthesizer is connected to the SDA/SCL serial interface bus. Multiple devices can be connected to the bus, but it may be necessary to reduce the speed (400 kHz is the maximum) if many devices are connected.

Note that the pullup resistors (R_P) depend on the supply voltage, bus capacitance, and number of connected devices. The recommended pullup value is 4.7 k Ω . It must meet the minimum sink current of 3 mA at $V_{OLmax} = 0.4$ V for the output stages (for more details see the SMBus or I²C Bus specification).

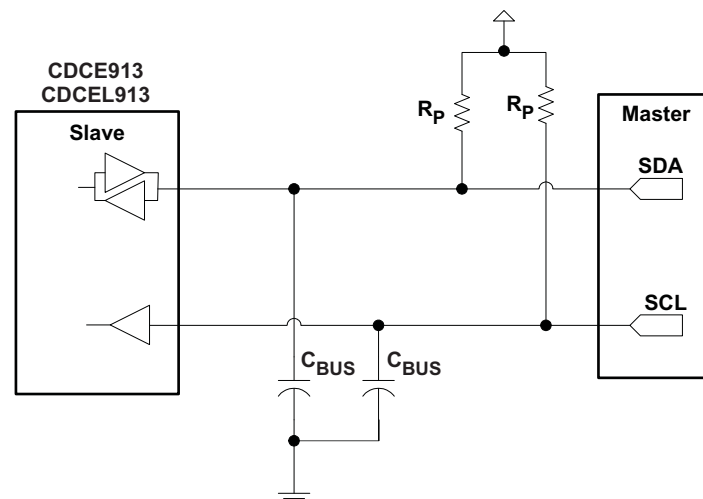

Figure 7. SDA / SCL Hardware Interface

8.5 Programming

Table 8. Command Code Definition

BIT	DESCRIPTION
7	0 = Block Read or Block Write operation 1 = Byte Read or Byte Write operation
(6:0)	Byte offset for Byte Read, Block Read, Byte Write, and Block Write operations

8.6 Register Maps

8.6.1 SDA/SCL Configuration Registers

The clock input, control pins, PLLs, and output stages are user configurable. The following tables and explanations describe the programmable functions of the CDCE913/CDCEL913. All settings can be manually written into the device through the SDA/SCL bus or easily programmed by using the TI Pro-Clock™ software. TI Pro-Clock™ software allows the user to quickly make all settings and automatically calculates the values for optimized performance at lowest jitter.

Table 9. SDA/SCL Registers

ADDRESS OFFSET	REGISTER DESCRIPTION	TABLE
00h	Generic configuration register	Table 11
10h	PLL1 configuration register	Table 12

The grey-highlighted bits, described in the configuration register tables in the following pages, belong to the control terminal register. The user can predefine up to eight different control settings. These settings then can be selected by the external control pins, S0, S1, and S2. See [Control Terminal Configuration](#).

Table 10. Configuration Register, External Control Terminals

	EXTERNAL CONTROL PINS			Y1	PLL1 Settings		
				OUTPUT SELECTION	FREQUENCY SELECTION	SSC SELECTION	OUTPUT SELECTION
	S2	S1	S0	Y1	FS1	SSC1	Y2Y3
0	0	0	0	Y1_0	FS1_0	SSC1_0	Y2Y3_0

	3:2	Y1_ST0	01b	00 – Device power down (all PLLs in power down and all outputs in 3-State) 01 – Y1 disabled to low 10 – Y1 disabled to high 11 – Y1 enabled
	1:0	Pdiv1 [9:8]	001h	10-bit Y1-output-divider Pdiv1: 0 – Divider reset and stand-by 1 to 1023 – Divider value
03h	7:0	Pdiv1 [7:0]		
04h	7	Y1_7	0b	Y1_x State Selection ⁽⁷⁾ 0 – State0 (predefined by Y1_ST0) 1 – State1 (predefined by Y1_ST1)
	6	Y1_6	0b	
	5	Y1_5	0b	
	4	Y1_4	0b	
	3	Y1_3	0b	
	2	Y1_2	0b	
	1	Y1_1	1b	
	0	Y1_0	0b	
05h	7:3	XCSEL	0Ah	Crystal load capacitor selection ⁽⁸⁾ 00h – 0 pF 01h – 1 pF 02h – 2 pF :14h to 1Fh – 20 pF
	2:0		0b	Reserved – do not write other than 0
06h	7:1	BCOUNT	20h	7-bit byte count (defines the number of bytes which will be sent from this device at the next <i>Block Read</i> transfer); all bytes must be read out to finish the read cycle correctly.
	0	EEWRITE	0b	Initiate EEPROM write cycle ⁽⁴⁾⁽⁹⁾ 0 – No EEPROM write cycle 1 – Start EEPROM write cycle (internal registers are saved to the EEPROM)
07h-0Fh		–	0h	Unused address range

(1) Writing data beyond '20h may affect device function.

(2) All data transferred with the MSB first

(3) Unless customer-specific setting

(4) During EEPROM programming, no data is allowed to be sent to the device through the SDA/SCL bus until the programming sequence is completed. Data, however, can be read out during the programming sequence (*Byte Read* or *Block Read*).

(5) If this bit is set to high in the EEPROM, the actual data in the EEPROM is permanently locked. No further programming is possible. Data, however, can still be written through the SDA/SCL bus to the internal register to change device function on the fly, but new data can no longer be saved to the EEPROM. EELOCK is effective only if written into the EEPROM.

(6) Selection of *control pins* is effective only if written into the EEPROM. Once written into the EEPROM, the serial programming pins are no longer available. However, if V_{DDOUT} is forced to GND, the two control pins, S1 and S2, temporarily act as serial programming pins (SDA/SCL), and the two slave receiver address bits are reset to A0 = 0 and A1 = 0.

(7) These are the bits of the control terminal register (see [Table 10](#)). The user can predefine up to eight different control settings. These settings then can be selected by the external control pins, S0, S1, and S2.

(8) The internal load capacitor (C₁, C₂) must be used to achieve the best clock performance. External capacitors should be used only to finely adjust C_L by a few picofarads. The value of C_L can be programmed with a resolution of 1 pF for a crystal load range of 0 pF to 20 pF. For C_L > 20 pF, use additional external capacitors. The device input capacitance value must be considered, which always adds 1.5 pF (6 pF/2 pF) to the selected C_L. For more about VCXO config. and crystal recommendation, see application report [SCAA085](#).

(9) The EEPROM WRITE bit must be sent last. This ensures that the content of all internal registers are stored in the EEPROM. The EEWRITE cycle is initiated with the rising edge of the EEWRITE bit. A static level-high does not trigger an EEPROM WRITE cycle. The EEWRITE bit must be reset to low after the programming is completed. The programming status can be monitored by reading out EEPIP. If EELOCK is set to high, no EEPROM programming is possible.

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The CDCE913 device is an easy-to-use high-performance, programmable CMOS clock synthesizer. It can be used as a crystal buffer, clock synthesizer with separate output supply pin. The CDCE913 features an on-chip loop filter and Spread-spectrum modulation. Programming can be done through SPI, pin-mode, or using on-chip EEPROM. This section shows some examples of using CDCE913 in various applications.

9.2 Typical Application

Figure 14 shows the use of the CDCEL913 in an audio/video application using a 1.8-V single supply.

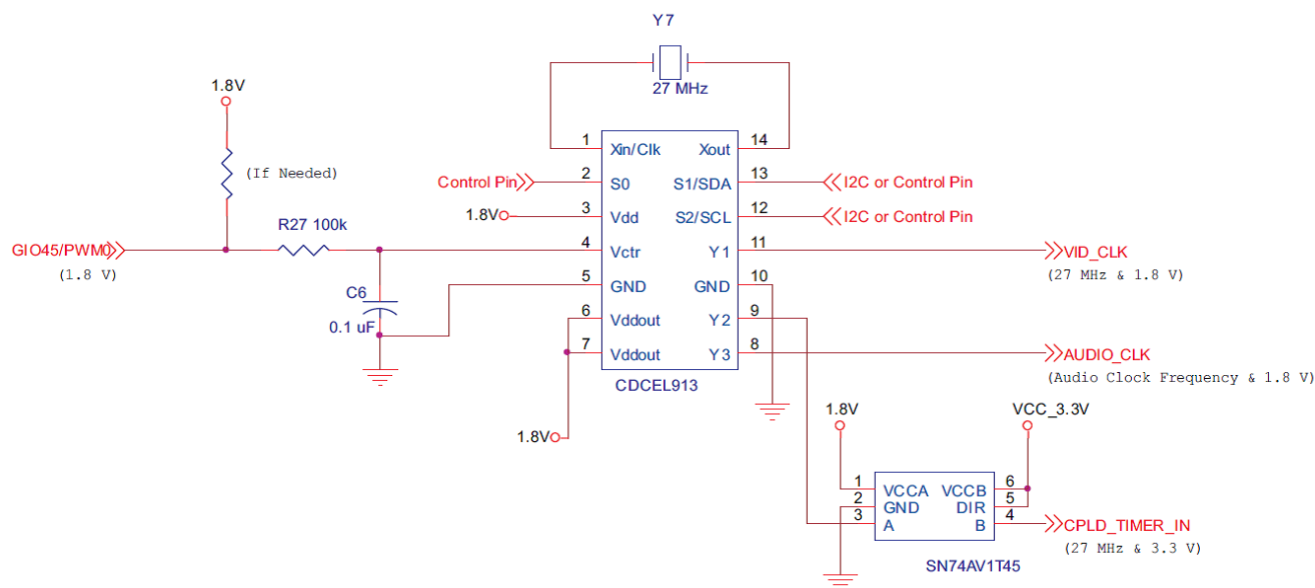

Figure 14. Single-Chip Solution Using CDCE913 for Generating Audio/Video Frequencies

9.2.1 Design Requirements

CDCE913 supports spread spectrum clocking (SSC) with multiple control parameters:

- Modulation amount (%)
- Modulation frequency (>20 kHz)
- Modulation shape (triangular, hershey, and others)
- Center spread / down spread (\pm or $-$)

Typical Application (continued)

Figure 15. Modulation Frequency (f_m) and Modulation Amount

Figure 16. Spread Spectrum Modulation Shapes

9.2.2 Detailed Design Procedure

9.2.2.1 Spread Spectrum Clock (SSC)

Spread Spectrum modulation is a method to spread emitted energy over a larger bandwidth. In clocking, spread spectrum can reduce Electromagnetic Interference (EMI) by reducing the level of emission from clock distribution network.

Typical Application (continued)

CDCS502 with a 25-MHz Crystal, FS = 1, Fout = 100 MHz, and 0%, ±0.5, ±1%, and ±2% SSC

Figure 17. Comparison Between Typical Clock Power Spectrum and Spread-Spectrum Clock

9.2.2.2 PLL Frequency Planning

At a given input frequency (f_{IN}), the output frequency (f_{OUT}) of the CDCE913/CDCEL913 can be calculated:

$$f_{OUT} = \frac{f_{IN}}{P_{div}} \times \frac{N}{M}$$

where

- M (1 to 511) and N (1 to 4095) are the multiplier/divide values of the PLL; Pdiv (1 to 127) is the output divider. (1)

The target VCO frequency (f_{VCO}) of each PLL can be calculated:

$$f_{VCO} = f_{IN} \times \frac{N}{M} \quad (2)$$

The PLL internally operates as fractional divider and needs the following multiplier/divider settings:

- N
- $P = 4 - \text{int}(\log_2 N/M)$; if $P < 0$ then $P = 0$
- $Q = \text{int}(N'/M)$
- $R = N' - M \times Q$

where

$$N' = N \times 2^P$$

$$N \geq M;$$

Typical Application (continued)

$$80 \text{ MHz} \leq f_{VCO} \leq 230 \text{ MHz}$$

$$16 \leq Q \leq 63 \mu\text{s}$$

$$0 \leq P \leq 4 \mu\text{s}$$

$$0 \leq R \leq 51 \mu\text{s}$$

Example:

for $f_{IN} = 27 \text{ MHz}$; $M = 1$; $N = 4$; $P_{div} = 2$

$$\rightarrow f_{OUT} = 54 \text{ MHz}$$

$$\rightarrow f_{VCO} = 108 \text{ MHz}$$

$$\rightarrow P = 4 - \text{int}(\log_2 4) = 4 - 2 = 2$$

$$\rightarrow N' = 4 \times 2^2 = 16$$

$$\rightarrow Q = \text{int}(16) = 16$$

$$\rightarrow R = 16 - 16 = 0$$

for $f_{IN} = 27 \text{ MHz}$; $M = 2$; $N = 11$; $P_{div} = 2$

$$\rightarrow f_{OUT} = 74.25 \text{ MHz}$$

$$\rightarrow f_{VCO} = 148.50 \text{ MHz}$$

$$\rightarrow P = 4 - \text{int}(\log_2 5.5) = 4 - 2 = 2$$

$$\rightarrow N' = 11 \times 2^2 = 44$$

$$\rightarrow Q = \text{int}(22) = 22$$

$$\rightarrow R = 44 - 44 = 0$$

The values for P, Q, R, and N' are automatically calculated when using TI Pro-Clock™ software.

9.2.2.3 Crystal Oscillator Start-up

When the CDCE913/CDCEL913 is used as a crystal buffer, crystal oscillator start-up dominates the start-up time compared to the internal PLL lock time. The following diagram shows the oscillator start-up sequence for a 27-MHz crystal input with an 8-pF load. The start-up time for the crystal is in the order of approximately 250 μs compared to approximately 10 μs of lock time. In general, lock time will be an order of magnitude less compared to the crystal start-up time.

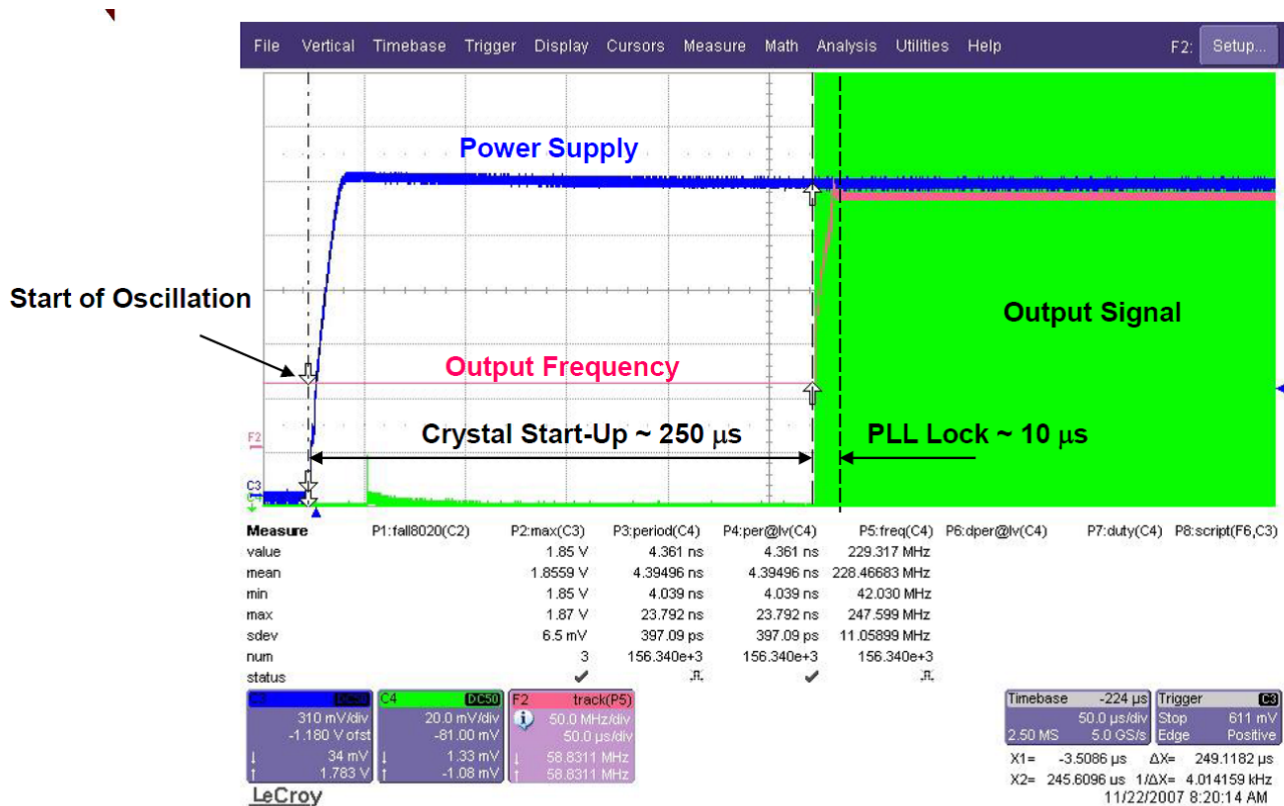

Figure 18. Crystal Oscillator Start-up vs PLL Lock Time

Typical Application (continued)

9.2.2.4 Frequency Adjustment with Crystal Oscillator Pulling

The frequency for the CDCE913/CDCEL913 is adjusted for media and other applications with the VCXO control input Vctrl. If a PWM modulated signal is used as a control signal for the VCXO, an external filter is needed.

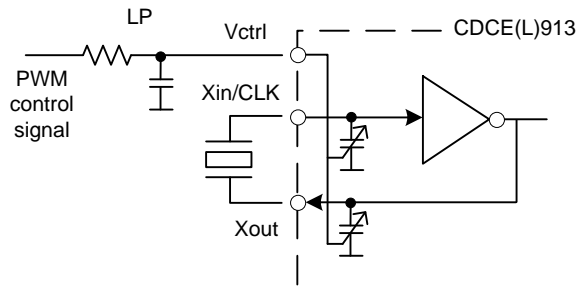

Figure 19. Frequency Adjustment using PWM Input to the VCXO Control

9.2.2.5 Unused Inputs/Outputs

If VCXO pulling functionality is not required, Vctrl should be left floating. All other unused inputs should be set to GND. Unused outputs should be left floating.

If one output block is not used, it is recommended to disable it. However, it is always recommended to provide the supply for the second output block even if it is disabled.

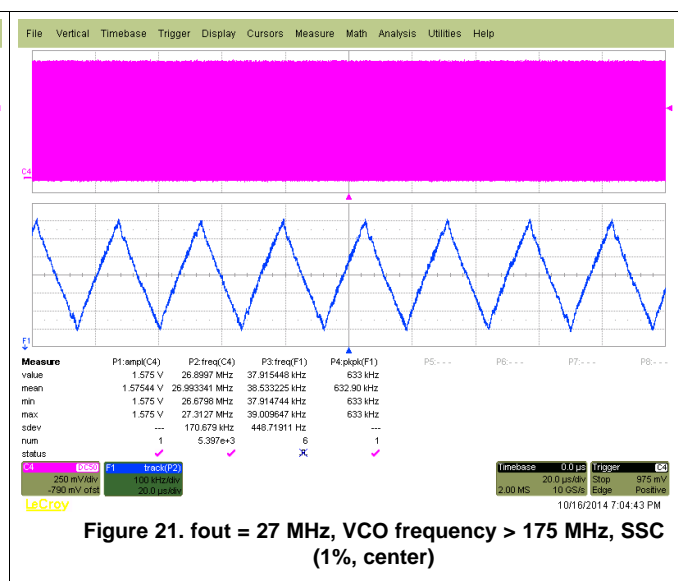

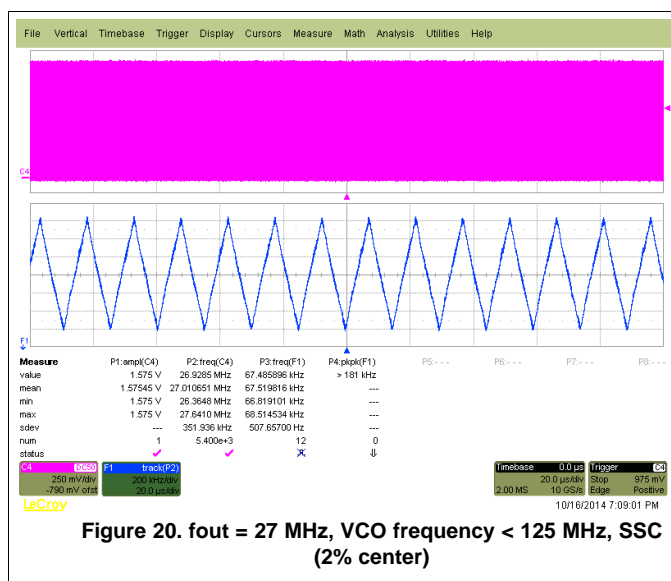

9.2.2.6 Switching Between XO and VCXO Mode

When the CDCE(L)913 is in crystal oscillator or in VCXO configuration, the internal capacitors require different internal capacitance. The following steps are recommended to switch to VCXO mode when the configuration for the on-chip capacitor is still set for XO mode. To center the output frequency to 0 ppm:

1. While in XO mode, put $V_{ctrl} = V_{dd}/2$
2. Switch from XO mode to VCXO mode
3. Program the internal capacitors in order to obtain 0ppm at the output.

9.2.3 Application Curves

Figure 20, Figure 21, Figure 22, and Figure 23 show CDCE913 measurements with the SSC feature enabled. Device Configuration: 27-MHz input, 27-MHz output.

Typical Application (continued)

10 Power Supply Recommendations

There is no restriction on the power-up sequence. In case VDDOUT is applied first, it is recommended to ground VDD. In case VDDOUT is powered while VDD is floating, there is a risk of high current flowing on the VDDOUT.

The device has a power-up control that is connected to the 1.8-V supply. This will keep the whole device disabled until the 1.8-V supply reaches a sufficient voltage level. Then the device switches on all internal components, including the outputs. If there is a 3.3-V Vddout available before the 1.8-V, the outputs will stay disabled until the 1.8-V supply has reached a certain level.

11 Layout

11.1 Layout Guidelines

When the CDCE913 is used as a crystal buffer, any parasitics across the crystal affects the pulling range of the VCXO. Therefore, care must be taken in placing the crystal units on the board. Crystals should be placed as close to the device as possible, ensuring that the routing lines from the crystal terminals to XIN and XOUT have the same length.

If possible, cut out both ground plane and power plane under the area where the crystal and the routing to the device are placed. In this area, always avoid routing any other signal line, as it could be a source of noise coupling.

Additional discrete capacitors can be required to meet the load capacitance specification of certain crystal. For example, a 10.7-pF load capacitor is not fully programmable on the chip, because the internal capacitor can range from 0 pF to 20 pF with steps of 1 pF. The 0.7-pF capacitor therefore can be discretely added on top of an internal 10 pF.

To minimize the inductive influence of the trace, it is recommended to place this small capacitor as close to the device as possible and symmetrically with respect to XIN and XOUT.

[Figure 24](#) shows a conceptual layout detailing recommended placement of power supply bypass capacitors. For component side mounting, use 0402 body size capacitors to facilitate signal routing. Keep the connections between the bypass capacitors and the power supply on the device as short as possible. Ground the other side of the capacitor using a low-impedance connection to the ground plane.

11.2 Layout Example

1

Place crystal with associated load caps as close to the chip

2

Place series termination resistors at Clock outputs to improve signal integrity

3

Place bypass caps close to the device pins, ensure wide freq. range

4

Use ferrite beads to isolate the device supply pins from board noise sources

12.3 Trademarks

DaVinci, OMAP, Pro-Clock are trademarks of Texas Instruments.

Bluetooth is a registered trademark of Bluetooth SIG, Inc.

All other trademarks are the property of their respective owners.

12.4 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

12.5 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish	MSL Peak Temp (3)	Op Temp (°C)	Top-Side Markings (4)	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

⁽⁴⁾ Multiple Top-Side Markings will be inside parentheses. Only one Top-Side Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Top-Side Marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Publication IPC-7351 is recommended for alternate designs.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
 - Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
